

DUST DUST DUST DUST DUST

a Dust is a world wide problem. Dust as you see in the background is all too common in most rural ares of the world

These are not the only places dust can be found. It has become so severe in mining areas, deserts, dry soil conditions, and agriculture regions , that it is now severely regulated by the EPA. It is distributed into the atmosphere by the severity of the blowing winds. The following is a list of facts concerning dust:

- Dust reduces farm yields by as much as 40%
- Dust obscures the sunlight and helps cause global warming
- Dust dirties the air we breathe causing lung and respiratory Diseases.
- In mines the dust pollution is usually more severe, as the dust contains carcinogens, sulphur, dioxin, pesticides, heavy metals and silica. all of which are bad for our health as well as our wildlife and livestock. through their ingestion of dust on their food sources which carry these poisons. These poisons are then transferred through the food chain to our own bodies.
